

## Applying Lean MFG Principles to Networking through Factorio

Darrel Manalang

Hello!

# I am Darrel Manalang

Network Engineer and Co-Founder at e-Mayhem

Darrel#7023

[darrelmanalang](#)

- Objectives

- **Spark Interest**

- Learning from Lean Manufacturing
- Provide a glimpse of my own DevOps journey

- **Provide Actionable Tips**

- A few things I learned from Lean
- Low-Tech with wide application

- Factorio and Manufacturing - What? Why?

## The Struggle

- Working in the wild west of a large startup
- 4-man on-call rotation
- Searched for a better way

- Factorio and Manufacturing - What? Why?

## DevOps did not work for me

- Solutions were not as applicable to networking
- Lack of a separate PROD env
- Automation tools were underdeveloped or not available

- Factorio and Manufacturing - What? Why?

## Creating My Own Methodology

- DevOps is heavily influenced by Lean
- Start with Lean and apply to Networking
- One Problem: Manufacturing made less sense to networking, than software development

- Factorio and Manufacturing - What? Why?

- Factorio

Manufacturing automation game where you:

- Mine resources
- To turn them into finished goods
- To research technologies
- To launch a rocket

- Factorio and Manufacturing - What? Why?

## **Factorio as a learning Vehicle**

- Popular among engineers
  - [https://www.reddit.com/r/factorio/comments/ikqt5k/any\\_real\\_life\\_engineers\\_here/](https://www.reddit.com/r/factorio/comments/ikqt5k/any_real_life_engineers_here/)
- Feels vaguely like work for a variety of different engineering professions
- I could apply Lean Mfg to Factorio and bring back to Networking

- Electric Engines Example: The Problem

- Electric Engines Example: The Solution

## Reduce Batch Size and WIP

### Benefits

- Faster lead times
- Less value tied up in the system
- Lower latency between change and result

## Mitigating Drawbacks with the Andon Cord

- Disruptive - Reveals issues previously hidden by inventory levels
- System is less forgiving

1

## Network Engineering Learnings: Alerting and The Andon Cord

- Alerting and the Andon Cord

## The Andon Cord at Toyota

Cord along the mfg line to pull and stop production

- Encouraged to pull anytime an issue was found
- Everyone would stop working to identify the cause and implement a solution
- System became more streamlined after each event
- Reduction in pulls/day is concerning

- Alerting and the Andon Cord

- Too Many

- Can't get any planned work done
- Alert Fatigue

Resolution:

Increase inventory levels  
(Decrease alerting sensitivity)

- Too Few

- Learning stagnates
- System reliability degrades over time

Resolution:

Decrease inventory levels  
(Increase alerting sensitivity)

2

## Network Engineering Learnings: Reducing Batch Sizes

- Reducing Batch Sizes

### In Manufacturing

- Provide value sooner
- Able to change tasks more quickly
- Defects are detected sooner

### Applied to Networking

Reduced a static route -> BGP cutover to a batch size of 1 route

- Was done during the day
- Small impact, success or failure
- Was able to schedule the change earlier, and detect an issue in my change sooner

3

## Network Engineering Learnings: The Dangers of WIP

- The Dangers of WIP

- In Manufacturing

- Value (money) tied up in the system
- Consumes space

Resolution: Pull System

- 100% utilization is avoided
- Work is requested from downstream

### Applied to Networking

More dangerous - our inventories are invisible

- Incomplete tasks
- Incomplete projects

*These are a few examples.  
There's plenty more to learn  
from Lean.*

Thank you!

Any questions?
